

Next Round: Hiring Challenge

LinkedIn Profile API

Challenge: Reverse engineer LinkedIn APIs and build a hosted API that accepts a LinkedIn profile URL and returns most of the information available on the profile page as structured JSON.

Requirements

- Deploy the API publicly over HTTPS.
- Accept a LinkedIn profile URL as input.
- Return details such as name, headline, location, about, experience, education, skills, certifications, languages, and profile images when available.
- You may use your own LinkedIn credentials in the backend.
- Submit a public GitHub repository containing the complete source code.
- Include a README with setup instructions, API documentation, your approach, and known limitations.
- Keep all credentials and secrets out of the repository.
- We need a purely reverse engineered solution that directly hits LinkedIn endpoints and does not use a browser.
